Available APIs in Su

Here is an overview of the APIs available with Su:

API Name	Description
Payment Gateway API	Setup PG directly for a property through API to get the CC tokenized on the fly and pass in reservation Json
iFrame	Service to get Su Window embedded into partner's extranet Works for both Mapping and Booking page CSS can be modified as required to match the color and pattern scheme of extranet
Widget	A more reliable option to iFrame. Works flow-less for both windows and ios. It is a tiny Java Script which needs to be add on the backend of the partner's mapping screen to get it executed. It auto triggers and CSS info is embedded in the script itself.
Users API	To create different users directly through API as required. User can be an Individual property user, a Global user or Chain (Group) user

API Name	Description
GET API – Property Data	GET Call to pull in list of all properties created under an account with information such as Id, name, status, etc...
GET API – Room Type	GET call to pull in the list of room types created under an individual property. Return with data including id, name, status, etc...
GET API – Rate Plan	GET call to pull in the list of rate types created under an individual property. Return with data including id, name, status, etc...
GET API – Quantity (total no. of rooms)	To be helpful in billing / invoicing process, a GET API to pull in the overall quantity (no. of rooms) of the property The API works on property level and gives total no. of rooms in return
GET API – Reservations list	API to pull in the basic data of existing bookings depending on booking date wise / range API call returns data with booking id created in between the date requested with status, check in and out date and channel id
